By William Thompson Would you like a software package that scans your car for license plates and returns your license plate number to you? This software could help with keeping track of your parking tickets, avoiding parking tickets and looking up license plate information. License plate recognition software can be found for almost any type of car, truck, SUV, minivan or sport utility vehicle. License plate scanners are typically installed inside parking facilities to automatically identify license plates. They are very expensive, making them available only to large companies with many parking lots, such as car rental agencies and parking management companies. Licence plate recognition software can be used on personal computers. The license plate number of your car can be typed in and the software will search through its database of all matching license plates. It will then show the plate number and the number of parking tickets and unpaid parking fees for that plate. How This Software Works License plate recognition is usually performed by a camera with a small antenna that can read the image of a license plate. The data is sent to a processor, which can also determine if the license plate has been tampered with and can replace the image with a close match. The matching data is then sent to a database where it can be accessed through a web browser. License plate recognition is a field that has seen a lot of development in the last few years. The technology is still evolving and this software is no exception. There is ongoing research into new sensors and recognition algorithms that can match license plates from greater distances. For example, license plate scanners made by AForge.Net or ICARUS are claimed to recognize license plates from 300 meters away, which is very impressive for a camera system. A high-speed license plate recognition system can scan over 120 license plates a minute, resulting in a real-time analysis of the information on the license plate. Data will be saved to a database and later sent to a web server for remote access. License plate recognition is one of the most used and practical ways to keep track of license plates. In the U.S. alone, millions of vehicles are involved in a parking enforcement program. A parking enforcement company, such as a taxi cab company, a school, a mall or a hospital may have a contract with the government to scan for expired plates. The license plate number and the date that the ticket was written is stored in the database. If the license plate number is not on the list, it may be a stolen plate or a registered 82157476af
